# Package 'hms'

August 23, 2019

Title Pretty Time of Day
<b>Date</b> 2019-08-23
Version 0.5.1
<b>Description</b> Implements an S3 class for storing and formatting time-of-day values, based on the 'difftime' class.
Imports methods, pkgconfig, rlang, vctrs (>= 0.2.0)
Suggests crayon, lubridate, pillar (>= 1.1.0), testthat
License GPL-3
Encoding UTF-8
LazyData true

hms: Pretty Time of Day

#### **Description**

Implements an S3 class for storing and formatting time-of-day values, based on the 'difftime' class.

#### **Details**

Stable

#### Author(s)

Maintainer: Kirill Müller <krlmlr+r@mailbox.org>

hms

A simple class for storing time-of-day values

#### **Description**

The values are stored as a difftime vector with a custom class, and always with "seconds" as unit for robust coercion to numeric. Supports construction from time values, coercion to and from various data types, and formatting. Can be used as a regular column in a data frame.

hms() is a high-level constructor that accepts second, minute, hour and day components as numeric vectors.

new\_hms() is a low-level constructor that only checks that its input has the correct base type, numeric.

is\_hms() checks if an object is of class hms.

as\_hms() forwards to vec\_cast().

3 hms

#### Usage

```
hms(seconds = NULL, minutes = NULL, hours = NULL, days = NULL)
new_hms(x = numeric())
is_hms(x)
as_hms(x)
## S3 method for class 'hms'
as.POSIXct(x, ...)
## S3 method for class 'hms'
as.POSIXlt(x, ...)
## S3 method for class 'hms'
as.character(x, ...)
## S3 method for class 'hms'
as.data.frame(x, row.names = NULL, optional = FALSE, ...,
  nm = paste(deparse(substitute(x), width.cutoff = 500L), collapse =
  ""))
## S3 method for class 'hms'
format(x, ...)
## S3 method for class 'hms'
print(x, ...)
seconds, minutes, hours, days
                Time since midnight. No bounds checking is performed.
```

#### **Arguments**

Χ An object.

additional arguments to be passed to or from methods.

NULL or a character vector giving the row names for the data frame. Missing row.names

values are not allowed.

logical. If TRUE, setting row names and converting column names (to syntacoptional

tic names: see make.names) is optional. Note that all of R's base package as.data.frame() methods use optional only for column names treatment, basically with the meaning of data.frame(\*,check.names = !optional). See

also the make.names argument of the matrix method.

Name of column in new data frame nm

#### **Details**

For hms, all arguments must have the same length or be NULL. Odd combinations (e.g., passing only seconds and hours but not minutes) are rejected.

parse\_hms

For arguments of type POSIXct and POSIXlt, as\_hms() does not perform timezone conversion. Use lubridate::with\_tz() and lubridate::force\_tz() as necessary.

# **Examples**

```
hms(56, 34, 12)
hms()

new_hms(as.numeric(1:3))
# Supports numeric only!
try(new_hms(1:3))

as_hms(1)
as_hms("12:34:56")
as_hms(Sys.time())
as.POSIXct(hms(1))
data.frame(a = hms(1))
d <- data.frame(hours = 1:3)
d$hours <- hms(hours = d$hours)
d</pre>
```

parse\_hms

Parsing hms values

#### **Description**

These functions convert character vectors to objects of the hms class. NA values are supported. parse\_hms() accepts values of the form "HH:MM:SS", with optional fractional seconds. parse\_hm() accepts values of the form "HH:MM".

#### Usage

```
parse_hms(x)
parse_hm(x)
```

#### Arguments

Х

A character vector

#### Value

An object of class hms.

#### **Examples**

```
parse_hms("12:34:56")
parse_hms("12:34:56.789")
parse_hm("12:34")
```

round\_hms 5

round\_hms

Round or truncate to a multiple of seconds

#### **Description**

Convenience functions to round or truncate to a multiple of seconds.

#### Usage

```
round_hms(x, secs)
trunc_hms(x, secs)
```

# **Arguments**

x A vector of class hms

secs Multiple of seconds, a positive numeric. Values less than one are supported

#### Value

The input, rounded or truncated to the nearest multiple of secs

#### **Examples**

```
round_hms(as.hms("12:34:56"), 5)
round_hms(as.hms("12:34:56"), 60)
trunc_hms(as.hms("12:34:56"), 60)
```

vec\_cast.hms

Casting

# Description

Double dispatch methods to support vctrs::vec\_cast().

#### Usage

```
## S3 method for class 'hms'
vec_cast(x, to, ...)
```

#### **Arguments**

x Vectors to cast.

to Type to cast to. If NULL, x will be returned as is.

... For vec\_cast\_common(), vectors to cast. For vec\_cast() and vec\_restore(),

these dots are only for future extensions and should be empty.

6 vec\_ptype2.hms

vec_ptype2.hms	
----------------	--

Coercion

# Description

Double dispatch methods to support vctrs::vec\_ptype2().

# Usage

```
## S3 method for class 'hms'
vec_ptype2(x, y, ..., x_arg = "", y_arg = "")
```

# Arguments

x	Vector types.
у	Vector types.
	These dots are for future extensions and must be empty.
x_arg	Argument names for x and y. These are used in error messages to inform the user about the locations of incompatible types (see stop_incompatible_type()).
y_arg	Argument names for x and y. These are used in error messages to inform the user about the locations of incompatible types (see stop_incompatible_type()).
